"Site-specific mutagenesis of PRDI DNA polymerase: mutations in highly conserved regions of the family B DNA polymerase.";

Biochem. Biophys. Res. Commun. 170:1294-1300(1990).

-i- FUNCTION: THIS POLYMERASE POSSESSES TWO ENZYMATIC ACTIVITIES:
DNA SYNTHESIS (POLYMERASE) AND AN EXONUCLEOLYTIC ACTIVITY THA DEGRADES SINGLE STRANDED DNA IN THE 3' TO 5' DIRECTION.
-i- CATALYTIC ACTIVITY: N DEGXYNUCLEOSIDE TRIPHOSPHATE =
N PYROPHOSPHATE + DNA(N).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

harvested from mice and used to provide a panel of antibody-secreting hybridoma cells as a subset of the complete B-cell repertoire). Nearly uniform binding to all antibody members of the repertoire was observed. The test was than repeated with the addition of a defined amount of analyte to the mixture. A small number of wells showed greatly decreased labelling and these antibodies represented the successful result of an initial screen for those which preferentially bind analyte.
                                                                                                                    A panel of 88 pentapeptides was designed on the basis of decreasing hydrophobicity and periodic variation of hydrophobic moment. The peptides were labelled with iodine-125 and tested with individual members of a basal antibody repertoire. (Spleen cells were

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Technique is useful in chromatographic separation, \bar{\mbox{purification}} and binding assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide is one of a panel, each of which have systemicly varied values of at least two parameters. A test protein is matched against the panel, and the paralogues with highest binding affinity are selected. Selected paralogues are bound to a matrix which is incorporated into the HPLC gel and used as affinity ligands.

                                AAR69875-969 are pentameric mimotopes designed on the basis of decreasing hydrophobicity and periodic variation of hydrophobic moment. All the pentapeptides are acetylated at the N-terminus except E12 (for FITC) (sic). E12 is not identified in the specification. The mimotopes are used in the method of the invention to obtain antibodies specifically and strongly reactive with a desired analyte. The mimotope is obtd. by reacting a panel of starting a mammal with an analyte (so as to identify a malyte-reacting Abs) and then reacting each of a panel of candidate mimotopes representative of a random set of 3D contours with the analyte-reacting Abs. A subject is immunised with one or more mimotopes identified and the
                                                                                                                                                                                                                                            Producing antibodies with high specificity and affinity for an analyte - by immunisation with selected mimotope, also analyte detection kits, useful for immunoassay of materials usually

                    The present peptide is a member of a panel of 88 pentapeptide minotopes designed on the basis of decreasing hydrophobicity, and periodic variation of hydrophobic moment. The panel was synthesised using the method of Geysen, H. M., et al, Proc. Natl. Acad. Sci. USA (1984), which uses lots of 96 pins; the remaining 8 polyethylene pins being controls. The minotopes were then mixed, 22 labelled and tested with individual members of a basal antibody (Ab) repertoire. Nearly uniform binding to all members was found. The test was then repeated with the addition of a defined ant. of analyte. A small number showed greatly increased labelling, these Ab representing the successful result of an initial screen for those that pref. bind analyte. The above is an example of a claimed method for identifying members of a panel of candidate drugs, that bind to a receptor having a known ligand. It is useful in rational drug design, e.g. selection of immunological reagents for any analyte, including those not normally detectable by immunoassay, e.g trace contaminants in soil,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Local Similarity 100 Matches 4; Conservative

                                                                                                                          (CDRs) carrying a cysteline noose and which have cytokine agonist and antagonist mechanisms of action. The method of the invention can be used to obtain peptide ligand mimetics capable of binding a target antigen. The binding members may also be used to provide agonists or antagonists of targets such as cytokines. In particular specific binding members for MIP-1 alpha receptors are useful for treatment of HIV infection and for in vitro investigation of mechanisms of HIV infection and for peptide ligand mimetics from CDR3 cysteine noose libraries provide a means to select a different and potentially more effective population of peptide ligands than direct display of similar cysteine noose ligands on the surface of bacteriophage. The products of the invention have anti-HIV activity. ANOB352-Y08378 and ANY08382-Y08398 are peptides used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cysteine noose; antibody variable domain; CDR; cytokine; agonist; complementarity determining region; antagonist; mimetic; antigen; MIP-1 alpha receptor; treatment; HIV infection; CDR3; anti-HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                        Sequence
                                                                                                                   'n
                                                                                                                                                                                                                                                                                                This invention describes the construction of libraries of antibody
                                                                                                                                                                                                                                                                                                                          Example
                                                                                                                                                                                                                                                                                                                                                 Cysteine noose antibody libraries

                                                                                                                                                                                                                                                                                                                                               This invention describes novel nucleic acid sequences from alkane metabolizing Candida yeasts, encoding cytochrome b5-polypeptide, its fragments, variants and mutations. The nucleic acids and polypeptides are used for the oxidation of long-chain alkyl compounds with at least 10C, and for the production of long-chain dicarbonic acids by oxidizing n-alkanes and fatty acids with at least 10C.

E. coli is transformed with the fusion gene and is cultured in the presence of biotin and a biotinylation enzyme, eg. B. This library was used to explore the general utility of biotinylated peptides and to expand their possible uses.

                                                                                                                                                                                                                           Biotinylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAR65091-106 are biotinylated peptides that were designed to fit the consensus sequence of the invention and a random peptide (AAR65090). The library was made so that the biotinylyation peptides would be expressed in a fusion protein at the N-terminus of cytoplasmic MBP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 10; Page 137; 146pp; English.
